

TechCorp IAM Solution Design

Executive Summary

TechCorp operates in more than 100 countries with over 150,000 employees and is currently undergoing a large-scale digital transformation. As the organization expands its cloud services, software platforms, and digital assets, effective Identity and Access Management (IAM) is essential to maintaining security, operational efficiency, and a positive user experience.

This solution focuses on two priority areas: enhancing user lifecycle management and strengthening access control mechanisms.

1. User Lifecycle Management Solution

Proposed Solution

Implement an automated Identity Governance and Administration (IGA) platform integrated with TechCorp's HR systems, Active Directory, cloud applications, and enterprise platforms.

The solution will automate Joiner, Mover, and Leaver (JML) processes to ensure users receive the correct access at the right time and that access is removed promptly when roles change or employment ends.

Key Features

- Automated user provisioning and de-provisioning
- Role-based access assignment
- Access approval workflows
- Periodic access reviews
- Self-service access requests
- Automated account recertification

Technologies

- Microsoft Entra ID (Azure AD)
- SailPoint Identity Security Cloud or Saviynt
- Active Directory
- HR system integration

Business Process Alignment

The solution integrates directly with existing HR and IT processes. Employee onboarding automatically triggers account creation and role assignment, while off-boarding immediately removes access across connected systems.

This reduces manual administration, accelerates onboarding, and minimises the risk of orphaned accounts.

Business Value

- Faster onboarding and off boarding
- Reduced administrative workload
- Improved security and compliance
- Lower risk of unauthorised access

Rationale

Manual identity management becomes increasingly difficult at TechCorp's scale. Automation improves accuracy, consistency, and security while supporting global operations.

2. Access Control Mechanism Solution

Proposed Solution

Implement a centralised access management framework based on Role-Based Access Control (RBAC), Multi-Factor Authentication (MFA), and Privileged Access Management (PAM).

Access permissions will be assigned according to business roles, ensuring employees only have access to resources required for their responsibilities.

Key Features

- Role-Based Access Control (RBAC)
- Least Privilege Access
- Multi-Factor Authentication (MFA)
- Single Sign-On (SSO)
- Privileged Access Management (PAM)
- Continuous monitoring and access reviews

Technologies

- Microsoft Entra ID
- Okta or Ping Identity
- CyberArk or BeyondTrust PAM
- Microsoft Authenticator

Business Process Alignment

The solution supports existing operational workflows while improving security. Employees gain streamlined access through Single Sign-On, while administrators maintain centralised visibility and control over permissions.

Privileged accounts receive additional security controls to protect critical systems and sensitive data.

Business Value

- Stronger protection against cyber threats
- Reduced risk of credential compromise
- Improved user experience
- Simplified access management
- Enhanced regulatory compliance

Rationale

As TechCorp expands its digital footprint, traditional password-based security is no longer sufficient. Combining RBAC, MFA, and PAM provides a layered security approach that balances protection with usability.

Alignment with Business Objectives

The proposed IAM solutions support TechCorp's strategic objectives by:

- Strengthening cybersecurity defences
- Improving operational efficiency through automation
- Supporting digital transformation initiatives
- Enhancing employee productivity and user experience
- Ensuring scalable access management across global operations
- Maintaining customer and stakeholder trust

Together, these solutions provide a secure, efficient, and scalable IAM framework capable of supporting TechCorp's continued growth and innovation.

Conclusion

The recommended IAM solutions address TechCorp's immediate challenges while supporting its long-term business strategy. By automating user lifecycle management and strengthening access controls through RBAC, MFA, SSO, and PAM, TechCorp can improve security, reduce operational complexity, and deliver a seamless user experience across its global environment.
